

Perf Test on Poker

The endpoints to do perf test on are,

- 1) **/game/play - Post**
- 2) **/game/ping - Post, Options**
- 3) **/game/setrestorestate - Post, Options**

Above endpoints are hit by the client to play the game after logging into the play mode. There can be chances that if the endpoints reach the threshold of handling multiple request it might break and increase the latency.

To do the request for the above endpoints, the primary data required is the session id.

Steps to generate session_id:

Step 1:

Do a post request to gettoken endpoint using the below url and data's,

Base_url = https://api.relaxg.net

end_point = /capi/1.0/casino/token/gettoken

Headers = {"Content-Type" : "application/json"}

```
Body = {  
  "gameref": "epicjoker",  
  "ticket": "testticket-priit3",  
  "partnerid": "1",  
  "mode": "dev",  
  "channel": "web",  
  "clientid": ""  
}
```

Expected : 200, status code

Get the token and userId from the response

Step2 :

Use the token and userId to generate session id:

Session_id_endpoint = :8001/game/rmlogin

Headers = {"Content-Type" : "application/json"}

```
Body = {  
  "token": <response_token>,  
  "userid": "<response_userId>",  
  "mode": "dev",  
  "partnerid": "1",  
  "channel": "web",  
  "clientid": "",  
  "g": "epicjoker",  
  "immediatePayouts": false  
}
```

Once the session_id is generated we can hit all the perf test endpoints by passing the id in the request body.
